We asked 1500 university students across Canada if the COVID-19 pandemic was affecting their access to sexual health services... 

**STUDENTS OF COLOUR ARE MORE LIKELY TO REPORT**
- DECREASED access to HIV testing/treatment compared to white students (31% VS. 19%)
- DECREASED access to STI testing/treatment compared to white students (31% VS. 23%)

**WOMEN ARE MORE LIKELY TO REPORT**
- DECREASED access to STI testing/treatment compared to men (30% VS. 22%)
- DECREASED access to reproductive health services compared to men (31% VS. 22%)

**LGBTQ+ STUDENTS**
Both LGBQ+ students (31%) and their heterosexual counterparts (26%) report similar DECLINES in access to reproductive health services.

More than a quarter of transgender students (28%) report DECREASED access to reproductive health services.

**HPV VACCINE**
Almost a quarter of students (24%) report DECREASED access to the HPV vaccine.

**Notes:** All statistical differences presented above are significant at the p<.05 level. Data presented is based on responses to the following question: “Compared to the time before COVID-19, please tell us if COVID-19 (and the strategies used to manage COVID-19) has impacted these things related to sexual health. Please tell us only if it has changed because of COVID-19.” Presented above is the percentage of participants that responded that their access “Has decreased because of COVID-19.” All analyses exclude those who chose “Not applicable” and “I don’t know/prefer not to answer”. Data was collected between December 22, 2020, and January 07, 2021, by Leger, a professional market research company.
